I'm trying to get RMclock to run on my Acer Aspire One running Acer Aspire One with 1.6 processor. All I have are a few files Rt Core 64 Driver Rmclock (of these two I'm unsure which is actually the driver and which is the executable). When I try to run either of the files I get this error: "Not a valid Win32 application". I'm unsure what to do to get RMclock to work. I need to be able to use RMclock on my desktop without it crashing when I run it. Any help would be greatly appreciated!

A: Unfortunately I cannot comment yet, so I'll post this as an answer: Go to the C:\Windows directory and move the file rtcore64.sys to somewhere else, like c:\mywindows\win7. If the older file is placed in the same directory as the new file, Windows might try to use the old file. I hope I've understood correctly what you need.

A: I found a way to get this working. - Download RtCore64.SYS - Add file to Windows\System32 (or c:\system32) - Add its location to your PATH variable in environment variables - Open CMD and navigate to the directory - Run: `dism /imms /add-driver /driver:r:\r\core\drivers\RtCore64.sys /driverstate:"64-bit driver service"` Once you run this command, you should be able to run RMclock without a problem.

A: I think this tutorial is exactly what you need. Since you have a 64 bit os, there is no way around this native hardware detection.

Q: How to make a GWT UiBinder UiComponent implement ParentSafeUiBinder? I want to make a UiBinder UiComponent implement the ParentSafeUiBinder and what is the recommended way to do it? I can use the "RegularUiBinder" but is there an advantage in doing this?

A: From the ParentSafeUiBinder documentation: Many UiB f678ea9f9e
